User Testing

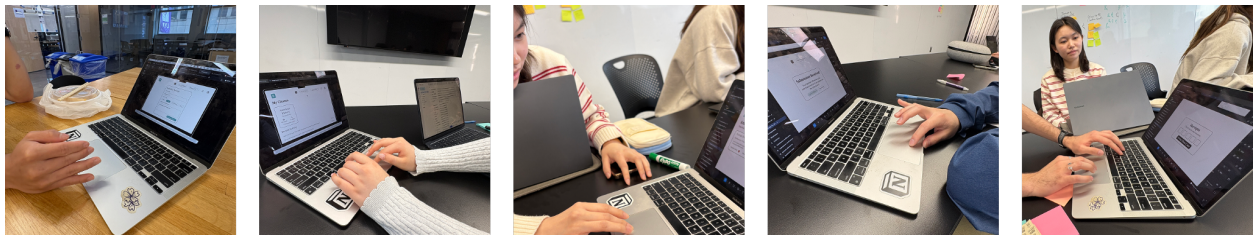

Script:

Receipts is a bulletin board where students upload their sources for teachers and the ReceiptsAI to evaluate their credibility. It's similar to Google classroom in structure and flow. This user flow should show you how to join a class, navigate the home page, view other posts, and submit a post for teacher review.

Follow-up Questions:

1. What were you drawn to first when you got to the home page? Was it clear how to make a post?
2. Did you notice the assignment description on the class page? Do you think it was visible enough?
3. What pages felt like they were missing the most?
4. Was the purpose of the product clear?

Evidence

Findings

From my testing notes:

- View teacher notes first thing to click on class page
- Make the current assignment bigger than the user posts
- Should be able to scroll through and click on the recent activity section
- How often would this be used? How could this product have more use cases?
- Highlight a specific part of the source to evaluate in the teacher notes

3 Insights:

1. The user flow worked for all testers, but generally there was a sense that the product could have more ways to interact with the posts.
2. Because the manual review step is included, there isn't an immediate validation of the post being up.
3. Readability and accessibility was not a problem, however there could be a clearer way to let users know what their assignments are.

2 Areas where Users Struggled:

1. Looking for places to interact with on the posts and not getting feedback.
2. Wanted a more populated prototype to get the sense that this was really a classroom/school ecosystem.

1 Change You Would Make Based on Testing:

1. Adding more clear ways to access your assignments from the home and class-specific pages, while also fleshing out and adding the actual teacher notes section to the prototype.
